3. Reflection:

With my “attention” web page being a memorial page to my pet hamster who passed away a few months ago, I wanted to draw the user’s attention towards my first element in screenshot 1 which worked well during the peer review. It worked well because upon loading the web page,

the first element takes up the entire screen and is aligned towards the center where the user's eyes would be typically fixated on when browsing on the web.

My second element in the top half of screenshot 2 was the next item I wanted to draw the user's attention which also worked well during the peer review. It worked well because the user needed to scroll down the web page in order to see this element, thus transitioning their attention away from the first element and now towards the second element.

As for my third element seen in the bottom half of screenshot 2, though it was the last item that drew my user's attention which I wanted and occurred during the peer review, my peers mentioned that this element of the "attention" web page could have been improved. Since each video had a different width, my peers mentioned that I could lay out the videos from either longest width to shortest width or vice versa which I agree with as it would make the layout of the videos more organized and in order rather than being disorganized and out of order.
